## We want to define the <u>property</u> eat and the <u>property</u> eat vegetables. Eat property represents a <u>person</u> eating <u>food</u>, whereas eating vegetables represent a <u>person</u> eating a <u>vegetable</u>. A <u>vegetable is a food</u>.

Hints:

- You can use the resources foaf:Person.
- You need to define the rdf:type, for Food and Person.
- For all new properties you define you should define their range and domain.

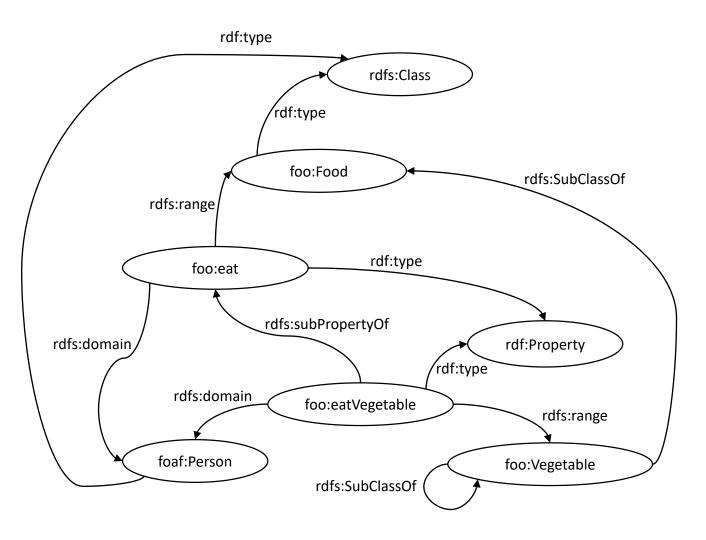

## We want to define the <u>property</u> eat and the <u>property</u> eat vegetables. Eat property represents a <u>person</u> eating <u>food</u>, whereas eating vegetables represent a <u>person</u> eating a <u>vegetable</u>. A <u>vegetable is a food.</u>

Hints:

- You can use the resources foaf:Person.
- You need to define the rdf:type, for Food and Person.
- For all new properties you define you should define their range and domain.
